BACKGROUND AND INTERESTS

My final project in the B.S., I explored unstructured P2P systems to assign and reassign applications in order to reduce the computing idleness and to improve the application response time. During my M.Sc., I investigated hybrid structures of P2P systems by combining unstructured and structured overlays and deploying applications using Bulk Synchronous Parallel (BSP) model to reduce the application response time. My current project in the Ph.D. (ENS-Lyon in France) consists of achieving elasticity on Big Data streams and I have been investigating models and solutions from queueing theory, graph theory, reinforcement learning, and big data analytics.

I have over 13 years of professional experience in industrial process analysis, software development and engineering, and management of IT projects.

My research interests include: machine learning, edge/fog computing, big data analytics, reinforcement learning, Internet of Things, optimization and placement problems, scheduling, and real-time systems.
